

## PHYTODIVERSITY OF ALIRAJPUR DISTRICT WITH SPECIAL REFERENCE TO CONSERVATION STRATEGIES

**JITENDRA SINGH PACHAYA, NAVIN K.JAIN**

**Abstract:** The current study was carried out in Alirajpur district, located in the western most part of Madhya Pradesh. Our study illustrates that 594 species of angiosperms under 452 genera belonging to 111 families. Out of these 110 species in 102 genera and 20 families belongs to Monocot and 484 species in 351 genera and 89 families belongs to Dicot. Herbs were dominating part in the flora of this province and it is followed by shrubs, grasses and trees (9.50%), whereas rest of 5 categories were in the range of 3.08-0.5%. However some areas and habitat types are still incompletely sampled and the survey is going on.

**Key words:** Alirajpur district, Phytodiversity, Madhya Pradesh, Conservation.

**Introduction:** The Flora of Madhya Pradesh province in India is very rich and diverse. Central, eastern and southern parts of the state are forested, whereas northern and western parts are deficient in forest [1]. Unpredictability In climatic and soil conditions brings about significant difference in the forest types and flora of the state. Bheel and Bhilala tribes live close to the forest and are largely dependent on the wild biological resources for their livelihood. They consume leaves flower, corm, fruits, rhizome and bulbs, which are considered as highly nutritional with high medicinal value. In district about 28% of the area is covered with forest whose total area counts to 1900 sq. km. The main products of the forest are wood, tendu leaves, mahua and bamboo. Local tribes are mostly dependent on forest for their daily needs. Though some scattered information is available on floristic survey in reference to its relationship with tribes of Alirajpur district but it is not sufficient [2],[3], [4], [5],[6],[7] Despite the presence of enormous and varied flora of Western Madhya Pradesh, the floristic diversity of the Alirajpur district has not been explored sufficiently. Even if some dotted information is available [5], [6], [7], and [8]. it is not it is not sufficient and systematic. Therefore, the present study has been carried out to collect the entire information on phyto diversity of Alirajpur

district.

**Study area:** Alirajpur District was carved out of Jhabua District on 17th May 2008. Alirajpur is predominantly a tribal district of Madhya Pradesh, located in the Western part of Madhya Pradesh. In the North-West it touches the state of Rajasthan while in the West it is surrounded by border of Gujarat. Maher and Narmada rivers make its Eastern and Southern border. Alirajpur district have divided into six blocks namely: Alirajpur, Sondwa, Kathiwada, Bhabra, Jobat and Uaigarh. Alirajpur district lying between 22°01'8"N latitude and 74°02'0"E longitude, covers an area of 3182 square kilometers (Fig.1). According to census 2011, Alirajpur population is 728,999. Alirajpur District average Rainfall is 850 mm. The temperature in this district ranges between 23°-30°C. Their major part is covered with dense forest in which various tribal like Bhil, Bhilala and Patliya are living in majority. Bhilala are the main inhabitants of different villages of the district. Mangoes, wheat, maize, pulses, spices, sorghum, garlic, chili, brinjal are major agriculture product. It is the biggest trading center of mangoes in Madhya Pradesh. The dryness of the climate and aridity different topography of the area provides a favorable ground to grow the plants.

**Materials and Methods:** Periodic and exhaustive floristic surveys were undertaken during 2011-2013 in Alirajpur forest division in the each locality and in each season of the year. The plants were dried and pressed and herbarium was prepared according to the routine methods [9]. All the plant specimens were critically studied and identified with the help of various floras and published literature [10-11]. The identification was also made by referring some authentic publications and deposited in the herbarium of Department of Botany, Government PG College, and Alirajpur.

**Results and Discussion:** The present study shows that 594 species of angiosperms under 452 genera belonging to 111 families are found in Alirajpur district (Table 1). Out of these 100 species in 102 genera and 20 families belongs to Monocot and 484 species in 351 genera and 89 families belongs to Dicot. In life form category herbaceous species represents the highest numbers of species i.e. (376 species) followed trees (105 species), shrubs (67 species), climbers (32 species) and Lianas (7 species).

It is also clear from the observed data that the ratio of monocot to dicot is higher than with respect to genera to species (Table 2). Whereas the ratio of monocot to dicot with respect to families is higher. On the other hand, the ratio of genera to species with respect to Dicot is higher than that of monocot and total. The comparative status of families genera and species in India, Madhya Pradesh and Alirajpur district also have been presented. The results also reveals that Poaceae (71 species) is the dominant family in this district followed by Fabaceae (64 species), Asteraceae (38), Euphorbiaceae (31 species), Acanthaceae (23 species), Convolvulaceae, (22 species), Malvaceae (20 species), Caesalpiniaceae (18 species), Cucurbitaceae (17 species), Apocynaceae (16

species), Solanaceae and Verbenaceae (14 species each). It is significant that the ten dominant families of the district as given in (Fig.9) comprise 321 species 46.38 % of the total species included in the present work while remaining 105 families with a total of 371 species constitute 53.61 %.

Results also indicate that *Euphorbia* and *Ipomoea* (11 species each) are the most dominant genus in the district followed by *Ficus* (7 species). In addition, some of the genera like *Aegle*, *Anthocephalus*, *Blainvillea*, *Chrysanthemum*, *Cissampelos*, *Costus*, *Diplocyclos*, *Wattakaka*, *Holarrhena*, *Hydrolea*, *Lagascea*, *Phyla*, *Tridax*, *Waltheria* and *Woodfordia* are represented in India by single species (including cultivated) also occur in the region. It was also observed that a good number of species are facing threat due to a number of manmade and natural factors.

**Conclusions:** Phytodiversity of Alirajpur district comprises a large diverse amount of plant species. This paper reports the floral biodiversity of Alirajpur district which may act as benchmark for the detailed study. Though present study attempted to trace the flora of the whole area, yet we feel that it was an incomplete survey. Due to some natural and manmade factors several species are under pressure for their existence. Proper conservation and management plans are needed to save the natural resources especially medicinal and declining plant species of the district. It is assumed that there is plenty opportunity that many plant species was left unrecorded hence need long-term comprehensive study to document flora and vegetation of the area in question. However, the present work will serve to students and researcher for the identification of plants of given area.
